* NOTE: This is a 'working draft' sequence. It currently
consists of 13 contigs. The true order of the pieces
* is not known and their order in this sequence record is
* arbitrary. Gaps between the contigs are represented as
* runs of N but the exact sizes of the gaps are unknown.
* This record will be updated with the finished sequence
* as soon as it is available and the accession number will
* be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1052: contig of 1052 bp in length

                                                                                             arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
NOTE: This is a 'working draft' sequence. It currently consists of 7 contigs. The true order of the pieces is not known and their order in this sequence record is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   .;

It currently consists of 19 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            gap of unknown length

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            alignment_scores:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             seq_documentation_block:

Sequence 39, Application US/08822774

Patent No. 6183997

GENERAL INFORMATION:

TILLE OF INVENTION: Polymerase Enhancing Factor (PEF)

TITLE OF INVENTION: Extracts, PEF Protein Complexes, Isolated PEF Proteins, TITLE OF INVENTION: and Methods for Purifying and Identifying Same NUMBER OF SEQUENCES: 61

NUMBER OF SEQUENCES: 61

ADDRESSEE: Lenhan, P.L.C.

STREET: 1200 G Street, N.W. Suite 700

STATE: D.C.

21P: 20005
                                                                                                                                                                                                                                                                           seq_name: /cgn2_6/ptodata/2/iaa/6B_COMB.pep:US-08-822-774-39
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      21P: 2005

polymerase enhancing factor (EFF) of pyrococcus furiosus DSM 3638.

The sequence is predicted from a DNA sequence (see AAV63860) obtained from genomic DNA by PCR. P45 and P50 (see AAV6386) obtained from genomic DNA by PCR. P45 and P50 (see AAV6386) obtained from genomic DNA by PCR. P45 and P50 (see AAV6386) obtained from genomic DNA by PCR. P50 (see AAV6386) obtained the activity of predominant components of PEE, which acts to enhance the activity of P. furiosus DNA polymerase. P45 functions as a dUTPase, and can be used to enhance uncleic acid replication, polymerisation or PCR complexes that improve the polymerisation activity of nucleic acid polymerases, as well as DNA constructs and antibodies. Also included are methods for identifying compositions with PEF activity. For purifying and using these compositions, and specific extracts, proteins and complexes that function to enhance polymerase activity. Composition having polymerase enhancing activity. Rits are provided for replicating nucleic acid sequencing or site-directed mutagenesis, for nucleic acid sequencing or amplification (preferably PCR or RT-PCR).

A sequence encoding a thermostable DNA ligase was cloned into the plasmid ppam-13. The DNA ligase is AFP dependent and is useful for detecting nucleic acids by hybridising two oligonuclectides with adjacent sequences of the target nucleic acid, ligating the two oligonuclectides (using the ligase) and detecting the ligation product. Analysis of the fragment revealed three other open reading frames (ORF's). This is a polypeptide encoded by ORF3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ::|||||| | |||:::::

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     These
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention provides a number of nucleotide and protein sequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from Coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacterium. Coryneform bacterium are useful for producing amino acids, nucleic acids, vitamins, saccharides and organic acids, particularly L-lysine. The present sequence is a protein described in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel polynucleotides derived from Coryneform bacteria, for identifying mutation point of a gene, measuring expression of a gene, analysing expression profile or pattern of a gene and identifying homologous gene

Haberhauer

Nucleic acids from Corynebacterium glutamicum encoding metabolic pathway proteins, useful for producing fine chemicals in microorganisms, including organic acids, nonproteinogenic amino acids, and purline and pyrimidine bases.

Claim 20; Page 1554; 1737pp; English.

AAF71753 to AAF72330 encode the Corynebacterium glutamicum metabolic pathway (MP) proteins given in AAB79634 to AAB0221. The C. glutamicum MP nucleic acids are useful for the production of fine chemicals in microorganisms, including organic acids, unoproteinogenic amino acids, purine and pyrimidine bases, nucleosides, nucleotides, lipids, saturated and unsaturated fatty acids, diols, carbohydrates, aromatic compounds, vitamins, cofactors, polyketides and enzymes.

The present sequence represents a Helicobacter pylori antigenic protein that is characterised by immunoreactivity with H. pylori-positive antisera. The proteins are highly immunogenic and induce a long-lasting immuno response that persists even after antimicriobial treatment. In antibody-detection assays, on sera, plasma, urine, sallaw etc., they previously unrecognised immunogenic cluster families. H. pylori antigens are used to detect H. pylori-specific antibodies, for diagnosing infection or to confirm eradication of infection, and in waccines to protect against H. pylori infection and related diseases (gastritis,

The present sequence represents a Helicobacter pylori antigenic protein that is characterised by immunoreactivity with H. pylori-positive antisera. The proteins are highly immunogenic and induce a long-lasting immuno response that persists even after antimicriobial treatment. In antibody-detection assays, on sera, plasma, urine, sallva etc., they are highly sensitive and specific. The specification also describes 69 previously unrecognised immunogenic cluster families. H. pylori antigens are used to detect H. pylori-specific antibodies, for diagnosing infection or to confirm eradication of infection, and in vaccines to protect against H. pylori infection and related diseases (gastritis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New Helicobacter pylori antigens and related nucleic acid sequences - useful in serological diagnosis and protective vaccines, providing long-lasting immune response

AAY36754-Y37949 are encoded by open reading frames (ORFs) of the genome of Chlamydia trachomatis. (see AAZ01425). The polypeptides can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, nonendemic trachoma, nonendemic trachoma, nonendemic trachoma, nonendemic paratrachoma, and inclusion conjunctivitis; genital diseases such as nongonococcal uretritis, epidymitts, cervicitis, salpingitis, perihepatitis, bartholinitis; pneumopathy in breast feeding infants; and venereal lymphogranulomatosis. The polypeptides of the invention may be of use in treating these diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              110

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AAY34584-Y35879 represent the proteins encoded by all the open reading frames in the complete genome (see AAX91990) of Chlamydia pneumoniae. C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent otitis media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAY34584-Y35879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae mucleotides sequences an also be used as immunogenic compositions, especially where the vector directs the expression of a neutralising epitope of C. pneumoniae.
                                                                                                                                                                                                                                                                                                                                                                                             / disease; pneumonia; bronchitis; heart disease; sarcoidosis; purulent otitis media; erythema nodosum; pharyngitis;
                                                                                                                                                                                                                                                                                                                                               Protein involved in intermediate metabolism of nucleotides

```

```
The present sequence represents a Pseudomonas aeruginosa polypeptide sequence. P. aeruginosa is an opportunistic human pathogen present in soil water and plants. The specification describes virulence polypeptides and nucleic acid sequence encoding such polypeptides. These sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Mahajan-Miklos S;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Amino acid sequence of a virulence factor encoded by ORF19027c.

can be used to identify a compound which is capable of decreasing the expression of a pathogenic virulence factor. Compounds that inhibit the expression or activity of virulence factor polypeptides can be used to treat pathogenic infections, especially where the infection note: a a caruginosa infection in the specification were poorly legible, and in some instances assumptions were made as to the identity of the residue; it is therefore possible that the sequence given below is not entirely correct.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ......AGAGAGGCTTTTGTTAAG......GGG 117

This invention relates to a full length provirus genomic DNA sequence AAC66281 of equine infectious anemia virus (EIAV) from the donkey tat. and 52 genes sequences AAC66314 - AAC66319 and their encoded proteins AAB35754 - AAB35759. The invention also relates to PCR primers AAC66282 - AAC66289 which are used to isolate the EIAV DNA sequences. Other primers represented in AAC66289 - AAC66313 are also used in the sequences identified in the invention. The genes and proteins can be used for preparing gene mutation and deletion vaccines, DNA vaccines and also because of in producing an equine infectious anemia virus gene transfer system for gene therapy. The proteins and polynucleotides may also be used in the study of HIV.
           Equine infectious anemia virus; EIAV; donkey leukocyte strain; vaccine; gene therapy; human immunodeficiency virus; pol; HIV.
                                                                                                                                                                                                                                                                                                                                                                                    Full-length DNA sequence of provirus genomes, sequences of various functional genes and protein of donkey leukocyte strain of equine infectious anemia virus, used for preparing vaccines and studying HIV
                                                                                                                                                                                                                                                                                      F)

A transformant selected for growth at 39 day was cultured overnight. Recombinant human dUTPase was purified and shown to be identical in sequence to the natural protomeric peptide (AAR70144).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Pure native human deoxyuridine tri:phosphate nucleotido:hydrolase - used to identify inhibitors, potentially useful as antimicrobial and anticancer agents

```
This polypeptide comprises the nuclear form, designated DUT-N, of muman decaywridine triphosphate nuclectidohydrolase (durpase). Its amino acid sequence was deduced from a T-cell cDNA clone (see AAT90987). A single gene codes for 2 isoforms of human durpase, the nuclear form (DUT-N, see AAT90281) which is targeted to the mitochondria. The isoforms arise by the which is targeted to the mitochondria. The isoforms arise by the cuse of alternative 5 exons which then join in a common sequence. The DUT-N isoform is produced at low or undetectable levels during non-proliferative periods of the cell cycle, and can be used as a marker for cellular proliferation. It is phosphorylated by placed: at a Ser residue within the consensus sequence for cyclin-dependent can be used to determine its proliferative farts or cellular proliferation. It is phosphorylated by placed: at a Ser residue within the consensus sequence for cyclin-dependent can be used to determine its proliferative farts or cellular proliferations. It is phosphorylated by placed in a cell can be used to determine its proliferative fact of calmed). This method can be used for determining the effect of calmed). Agents that inhibit durpase are potential

(claimed). Agents that inhibit durpase are potential

can throadpastic, antiviral, antibacterial and antifungal agents.

The durpase can also be used to raise antibodies for assaying the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      93 elleAspValGlyAlaGlyVallleAspGluAspTyrArgGlyAsnValG 110

```
This polypeptide comprises the mitochrondrial form, designated DUT-W, of human decoyuridine triphosphate nucleotidohydrolase (dUTPase). Its amino acid sequence was deduced from a fibroblast (dUTPase). Its amino acid sequence was deduced from a fibroblast considers, the nuclear form (DUT-W), see AAW30280 and the cytoplasmic form (DUT-M) which is targeted to the mitochondria. The isoforms arise by the use of alternative 5' exons which then join in a common sequence. The DUT-W isoform is detectable in proliferating and non-proliferating cells, but is produced in tumours. Unlike DUT-W, it is not phosphorylated in vivo. Weasuring the amount of dUTPase in a cell can be used to determine its proliferative status (or changes in this status), particularly in nutrient-deprived or neoplastic cells (claimed). This method cells, or monitoring the effect of (A) (claimed). Agents that an election the diffect of anticancer agents (A) on cells, or monitoring the effect of (A) (claimed). Agents that antihothed be used for assaying the enzyme and for drug screening.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 61 TCGCTCCAACCAGCAGGTTATGACCTCAGAGTGGGCAGAGAGGCTTTTGT 110

P. aeruginosa is an opportunistic human pathogen present in soil water and plants. The specification describes virulence polypeptides and nucleic acid sequence encoding such polypeptides. These sequences can be used to identify a compound which is capable of decreasing the expression of a pathogenic virulence factor. Compounds that inhibit the expression or activity of, virulence factor polypeptides can be used to treat pathogenic infections, especially where the infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            present sequence represents a Pseudomonas aeruginosa polypeptide
